### Positioning

#### Ans:

Kivi is an academic memory companion. It remembers what you tell it about your coursework, deadlines, marks, why results went the way they did, and uses that to help you decide what to do next. It's not a chatbot starting from zero. Not a calendar that only knows dates. Most tools that remember you do it quietly, by guessing, and turn one missed deadline into a character judgment. Kivi does the opposite. It remembers only what you said, shows the evidence behind every suggestion, and lets you correct, expire or delete anything. Kivi knows only what you've told it, and it shows its work.

## Vision

**Ans:**

| <b>Vision</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>The future behavior</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"><li>● What using Kivi should feel like is Calm Reliable and Unobtrusive.</li></ul> <p>Kivi should feel like a quiet assistant who happens to remember the important things you've already said, and brings them back at the right moment, not all the time. You should never feel watched. Never feel profiled. You should feel like your own words are being kept safe and handed back to you when they're actually useful.</p> | <ul style="list-style-type: none"><li>● Over time Kivi should help someone:</li></ul> <p>One is avoid repeating course specific mistakes, because the reason behind the last one is still visible.</p> <p>Start earlier, because the pattern of rushing is right there in history, and it's something the user said, not something we guessed.</p> <p>Connect old lessons to current work, like "last time I studied the wrong chapter so this time Ill check the syllabus first", without needing to be told twice.</p> <p>The goal is continuity without checking. Helpfulness without assuming anything. A memory that serves the user, not a system that models them.</p> |

### **What Kivi must never become**

- Kivi must never become a system that:  
Profiles the user like some government.  
Guesses emotions from tone or word choice.  
Calls them lazy, unmotivated, or anything else they didn't say about themselves.  
Keeps random conversations just because it can.  
Quietly makes decisions from stale information.  
Treats one score or one missed deadline as proof of character.  
If Kivi ever feels like it knows something you didn't tell it, something has gone wrong.

### **The core principle**

- Memory should be useful only when its:  
  
Explicit. Stated by the user, not inferred.  
Relevant. Tied to a course, task or pattern the user cares about right now.  
Evidence backed. Traceable to a specific statement, with a date and source.  
Visible. The user can see what Kivi remembers and why. Editable. The user can correct it.  
Removable. The user can delete it or mark it no longer relevant.

### Beyond students

The same design carries into working life without changing the principles. Courses become projects. Deadlines become meetings and deliverables. Marks become retrospectives. Study preferences become preferred work styles. The reasons people give for a good or bad outcome, like "I rushed it", "I didn't have the context", "I should have asked earlier", are just as useful at work as they are in school and just as easy to lose.

Kivi's approach scales because it doesn't depend on academic specifics. It depends on one simple discipline. Remember only what the user explicitly says, show the evidence, and let them stay in control. That discipline works wherever someone is trying to learn from their own history without being surveilled by it.
